AMENDMENT TO THE CLAIMS

Claim 1. (Currently Amended) A materials management system, comprising:

a remote operation center that coordinates at least one portion of the materials management system, and that receives at least one attribute of at least one material flow item, wherein the at least one material flow item enters the at least one portion of the materials management system, and wherein said remote operation center updates the at least one attribute to at least one updated attribute to reflect entry of the at least one material flow item into the at least one portion; and

at least one receiving station in the at least one portion that transmits the at least one attribute to the remote operation center, and that receives the at least one update attribute from the remote operation center, over an interconnection external to the at least one portion;

wherein a provider of delivery services gathers the at least one material flow item from said at least one receiving station and moves the at least one material flow item within the material management system through the at least one portion that transmits the at least one attribute to the remote operation center, and that receives the at least one updated attribute from the remote operation center;

wherein the at least one attribute and the at least one updated attribute are transmitted, entered, checked, and verified at the receiving station by scanning an identification of the at least one receiving station, and the at least one material flow item, and the provider of delivery services, and

wherein said at least one attribute includes at least an identification barcode.

Claim 2. (Original) The materials management system of claim 1, wherein the remote operation center is accessible from any communicative connection with the external interconnection.

Claim 3. (Original) The materials management system of claim 1, wherein the at least one attribute and the at least one updated attribute comprise at least one selected from the group consisting of a specific location, color, shape, size, addressee, status, a signatures record, present location, desired delivery destination, contents, and weight.

Claim 4. (Original) The materials management system of claim 1, wherein the remote operation center comprises at least one copy link.

Claim 5. (Original) The materials management system of claim 4, wherein the copy link provides a link from the remote operation center to real-time operations at at least one of the receiving stations.

Claim 6. (Original) The materials management system of claim 4, wherein the copy link provides a link from the remote operation center to legacy systems at at least one of the receiving stations.

Claim 7. (Original) The materials management system of claim 1, wherein the at least one receiving station comprises an infrared scanner communicatively connected to a programmable electronic device.

Claim 8. (Original) The materials management system of claim 7, wherein the programmable device is a PDA.

Claim 9. (Original) The materials management system of claim 8, wherein the external interconnection comprises a wireless modem communicatively connected to the PDA.

Claim 10. (Original) The materials management system of claim 8, wherein the external interconnection comprises a docking station communicatively connected to the PDA, and wherein the PDA batches at least one of the at least one attributes for a predetermined interval prior to transmittal to the remote operation center.

Claim 11. (Original) The materials management system of claim 1, wherein at least one receiving station comprises a barcode printer, and wherein at least one updated attribute comprises a barcode that is printed at the barcode printer for placement on the at least one material flow item.

Claim 12. (Original) The materials management system of claim 1, wherein at least one updated attribute comprises previous ones of the receiving stations through which the at least one material flow item has passed.

Claim 13. (Original) The materials management system of claim 1, wherein one of the at least one receiving stations comprises a delivery station, and wherein the delivery station comprises a final receiving station through which the at least one material flow item passes.

Claim 14. (Currently Amended) A method of controlling a materials management flow including at least one inventoried item moving through at least two distinct geographic locations, comprising:

scanning the at least one inventoried item upon entry into the materials management flow at a first local receiving station and scanning an identification of the first local receiving station, said first local receiving station located at a first of the distinct geographic locations;

scanning the at least one ~~inventory~~ inventoried item upon exit from the first local receiving station;

scanning the at least one inventoried item at at least one secondary receiving station ~~prior to~~ upon delivery of the item to the secondary receiving station, and scanning the identification of the secondary receiving station, said secondary receiving station located at a second geographic location distinct from the first geographic location;

scanning the at least one inventory item upon exit from the second local receiving station;

scanning the at least one inventoried item at at least one tertiary receiving station upon delivery of the item to the tertiary receiving station, said tertiary receiving station located at a third geographic location distinct from the first and the second geographic locations;

scanning the identification of the at least one tertiary receiving station upon final delivery of the item; and

transmitting, entering, checking, and verifying the item's placement at at least one of the at least one secondary receiving station, and the at least one tertiary receiving station, at a remote operation center externally connected to the first local receiving station, the at least one secondary receiving station, and the at least one tertiary receiving station.

Claim 15. (Previously Presented) A method of controlling a material flow, comprising:

coordinating of at least one portion of the materials management system at a remote operation center;

externally transmitting at least one attribute to the remote operation center from at least one receiving station;

receiving the at least one attribute of at least one material flow item in the at least one portion of the materials management system at the remote operation center;

updating the at least one attribute to at least one updated attribute at the remote operation center;

externally transmitting the at least one update attribute from the remote operation center to the at least one receiving station;

gathering at least one material flow item from the at least one receiving station by a provider of delivery services; and

transmitting, entering, checking, and verifying the at least one attribute and the at least one updated attribute at the at least one receiving station by scanning an identification of the at least one receiving station, the at least one material flow item, and the provider of delivery services.

Claim 16. (Previously Presented) A method of controlling materials in a material flow, in accordance with at least one updated attribute of each of the controlled materials, comprising:

receiving the at least one updated attribute at an at least one local receiving station, in accordance with an entry of the at least one updated attribute;

transmitting an at least one local attribute, from the at least one local receiving station, to a remote operation center, responsively to said receiving the at least one updated attribute, wherein the at least one updated attribute, and the at least one local attribute at the local receiving station, and a receipt of the transmitted at least one local attribute at the remote operation center, are substantially simultaneously reviewable at the at least one local receiving station.

Claim 17. (Original) The method of claim 16, further comprising modifying the at least one local attribute at the remote operation center, wherein the modified at least one local attribute is additionally substantially simultaneously reviewable at the at least one local receiving station.

Claim 18. (Original) The method of claim 17, further comprising controlling the material flow of the controlled material at said at least one receiving station in accordance with the at least one modified attribute and the at least one updated attribute.

Claim 19. (Previously Presented) The method of claim 18, wherein said controlling comprises receiving at least one system operator command from the local receiving station, wherein the system operator command is responsive to the substantially simultaneous review at the at least one local receiving station by a system operator.
